#### **HANDOUT #2**

EM200 Methods of Research Engr. Reynaldo P Ramos, PhD M-F 5:00-8:00PM Summer 2019 CED Building

1. What is Abstract? It is a brief and concise descriptive summary of statement of the problem, hypotheses, significance of the study, research design, determination of sample size, sampling design and technique, the research instrument and validation, data processing and method, statistical analysis, findings, conclusions and recommendations.

#### Forms of Abstract:

- a. Short Form it consists of 100-250 words and normally used for publication of research paper in a journal.
- b. Extended Form it consists of 500 900 and being used in research paper contest; and presentation of scientific papers during symposium, seminars and conference.
- c. Long Form it consists of 900-1000 words and being used in master's thesis and PhD dissertation

## 2. Characteristics of a Research Problem/Research Objectives

S-pecific: the problem should be specifically stated

M-easurable: it is easy by using research instruments, apparatus, or equipment

A-chievable: can be achieved using correct statistical tools to arrive at precise results

R-ealistic: real results are attained because they are gathered scientifically and not manipulated or maneuvered

T-time-bound: time frame is required in every activity because the shorter completion of the activity, the better.

In addition, a good research problem should be: (a) interesting, (b) innovative, (c) cost-effective, (d) relevant to the needs and problems of the people, (e) relevant to government thrusts, (f) measurable and time-bound.

**Research Objective** is defined as statement of purpose for which the investigation is to be conducted. It is a guide to be accomplished by the researcher in conducting a study. It has the same characteristics, SMART with research problem.

## 3. Components of the Research Process

- (a) Selecting a research topic and research proposal writing, (b) Reviewing of literature, (c) Deciding on the research approach and technique to data collection, (d) Designing formal for primary and secondary data collection, (e) Data measurement and coding, (f) Analysis of the results, (g) Structuring and writing the research.
- (b) According to *Paler-Calmorin & Calmorin (2007)*, the research process consists of the ff: (1) problem/objectives, (2) hypotheses, (3) theoretical/conceptual framework, (4) assumptions, (5) review of related literature, (6) research design, (7) data collection, (8) data processing and statistical treatment, (9) analysis and interpretation, (10) summary, conclusions and recommendations

#### 4. Literature Review

A literature is an independent works or brief introduction to the reports of new primary data with different focuses, goals, perspectives, strategies, organization and audiences. It can also focus on research outcomes, research methods, theories and applications. It provides background to and context for the research and to establish a bridge between the research study and the existing body of knowledge on the research topic. It is a process in which the researcher "critically" reviews available literature directly or indirectly related to the conduct of the research. There are three main reasons why a literature is necessary: (a) determining what research has been done on the research topic, (b) determining what level of theory and knowledge development relevant to the research topic, (c) determining relevance of the current/existing knowledge in relation to research problem.

Odiongan, Romblon *Tel. no.* (042) 567-5952

## **Major Steps to Literature Review**

(a) Determine when to conduct a search, (b) Delimit what is searched, (c) Access database for books, journals, and documents, (d) Organize the information gathered, (e) Critically evaluate the literature, (f) Write the literature review

# **Primary Techniques for Incorporating Source Material**

Example: The example for each technique is based on the statement, "Skin cancer is generally divided into two main classes, nonmelanomas and melanomas, both types affecting different types of skin cells" (Joyce 2005, 143).

Technique	Description	Example
Quoting	Exact words used in the original	"Skin cancer is generally divided
	are placed in quotation markers	into two main classes."
Paraphrasing	Information from a source is	There are two primary types of
	restated in a that retains the	skin cancer.
	essence of the original statement	
Summarizing	Key points from the source	The type of skin cell affected
	material are rewritten in a more	depends on the type of skin
	succinct, more focused way in the	cancer.
	student's own words	

### **Example of Citation Styles**

The three most common citation used style guides/publication are the following: (a) American Psychological Association, (b) the University of Chicago Press, and the (c) Modern Language Association.

Citation Style	Journal	Book	Web Source
APA	Journal Article without Digital Object	Shotton, M.A. (1989).	PZ Myers. (2007, January 22). The unfortunate

#### 5. What is a Research Design?

Some definitions of research design are as follows:

- A technical document where the decisions to conduct a research project, including some exploratory work have been stated, justified, evaluated and completed
- An overall action plan or scheme which contains specific structure and strategy of investigation to obtain answers to identified research questions and to control variance.
- A process link research questions, empirical data, and research conclusions
- Considered as a working document derived from courses/modules taken in research methods/methodology, as well as an output from the discussions between the supervisor and a student
- It aims to provide framework for the collection, analysis and interpretation of data; and it specify or designate the logical manner by which the variable units are compared and analyzed

#### 6. Basic Elements of a Research Design

The fundamental stages by which choices need to be made are as follows. (a) research topic/problem, (b) research questions and objectives, (c) research methods, techniques and strategies, (d) research concepts, hypotheses and models, (e) data sources, types of and forms, (f)selection from data sources, (g) data collection and timing, (h) data reduction and analysis. In general, a research design needs to answer basic questions: what will be studied? Why will it be studied, and how will it be studied? The selection or choice of a research design is the most important decision to make because this decision greatly influence s and have direct impacts in the prospective results of the study. Every type of research design setting has its own individual central characteristics and expected outcomes as illustrated in the table below.

Туре	Characteristics	Outcome
Sample survey	- It deals with a fraction of o total population	- Data analysis is based on a simple
	- It employs a sampling method to provide a sample that	relationship between two variables
	represents the total population	- It utilizes both qualitative and quantitative
	- Test hypotheses are also established	analysis
Field Study	- It concern primarily with processes and patterns under	- The data gathered enable to test many
	investigation (community, group)	hypotheses compare to the sample survey
	- It emphasizes on the social structure and social	<ul> <li>General control through focusing on</li> </ul>
	interactions	subgroup of larger population
Case Study	- Intensive analysis of a single instance of a phenomenon	- Concepts is discovered and tested
	being investigated	<ul> <li>Cases are coded and statistically tested</li> </ul>
	- It attempts to discover unique features and common	
	characteristics	
	- Cases is grouped by type to discover uniformities	
Combined	- Survey methodology is utilized to determine relationship	Creation of two databanks,: case study analysis
survey ad case	in a correlational pattern, and then interpreted using	and statistical data
study	case study to discover patterns and processes	Relationships accompanied by process and
	- Cases selected from the results of the survey analysis	pattern data
	particularly with significant results

#### **Designing a Research Strategy**

- (a) What type of research topic/study are you working? (b) How much time do you have? (c) What type of information do you need?
- 7. Variables It is defined as a quantity susceptible of fluctuation or change in value or magnitude under different conditions.

  Numerical values or categories represent these quantities.

#### **Types of Variables:**

- a. Independent variable the stimulus variable which is chosen by the researcher to determine its relationship to an observed phenomenon. This is the one being manipulated.
- b. Dependent variable this is the response variable which is observed and measured to determine the effect of the independent variable it changes when the independent variable varies.
- c. Moderate variable this is a secondary or special type of independent variable to determine if it changes or modifies the relationship between the independent and dependent variables.
- d. Control variable this is a variable that is controlled in which the effects can be neutralized by eliminating or removing the variable.
- e. Intervening variable this is a variable which interferes with the independent and dependent variables, either its strengthen or weaken these variables.

#### REMINDER: REQUIRED READINGS FROM PALER-CALMORIN AND CALMORIN (2007)

Read Chapters 1 & 2. Try to answer the exercises after each chapter. Please refrain from looking at the key answers prior to answering the questions. The handouts are only summaries of these chapters, thus it is still good to read the book for better understanding and to augment your learning.
